

The little teeth on the outside are called cilia. There are little hairs that sense prey and when they do it closes slowly and digests them over about 1 week.

There diet is small animals and insects. they are found in north Mexico, east England, west England and north Europe.

Venus Fly Trap

A Venus Fly Trap can grow to 5 inches (13cm). A Venus Fly Trap lives in bog like coastal areas with 80% humidity. They like poor, low quality soil. This is why they trap insects.
