

The invention of the book by Bronwyn

(This published copy will only stay relevant 1400-1800)

William Ivins and Robert Darnton have recently introduced an invention, completely taking over the world and expanding the current education system. His invention is new, exciting and will certainly change our perspective on learning.

Currently being named as "books" this new tool was said to be strongly influenced by the Greeks though we will be focusing on its affect on Rome and its origins.

Ever since the invention of papermaking and paper itself was founded by China the world has never been the same. Ancient Egypt has also been famed for making paper out of papyrus and carvings in wood have been dated all the way back to the Viking era. Though these examples are in hieroglyphic etc. history has always dreamed of reading things instead of just speaking aloud. Romans had gotten quite close to this fantasy with the invention of tablets and other useful tools. Although, there were a lot of downsides and problems with these.

So, the book was introduced. Recently, "libraries" and "bookstores" have been spreading throughout Rome. They are also helping more people understand and learn Latin. This will be particularly useful when people who are foreign to Latin need to communicate or translate.

In summary, the book has large potential in the educational world as reading has become easy, pleasurable and exciting. But who knows what is next in the universe of pioneering and literature? We'll just have to wait and see.
